## Giving

[ *Entity*   **given-value**  
*Funcon*   **initialise-giving**  
*Funcon*   **give**  
*Funcon*   **given**  
*Funcon*   **no-given**  
*Funcon*   **left-to-right-map**  
*Funcon*   **interleave-map**  
*Funcon*   **left-to-right-repeat**  
*Funcon*   **interleave-repeat**  
*Funcon*   **left-to-right-filter**  
*Funcon*   **interleave-filter**  
*Funcon*   **fold-left**  
*Funcon*   **fold-right** ]

*Meta-variables*    $T, T' <: \text{values}$   
 $T? <: \text{values?}$

*Entity*   **given-value**( $\_ : \text{values?}$ )  $\vdash \_ \longrightarrow \_$

The given-value entity allows a computation to refer to a single previously-computed  $V : \text{values}$ . The given value ( ) represents the absence of a current given value.

*Funcon*   **initialise-giving**( $X : ( ) \Rightarrow T'$ ) :  $( ) \Rightarrow T'$   
 $\rightsquigarrow \text{no-given}(X)$

**initialise-giving**( $X$ ) ensures that the entities used by the funcons for giving are properly initialised.

*Funcon*   **give**( $\_ : T, \_ : T \Rightarrow T'$ ) :  $\Rightarrow T'$

---

\*Suggestions for improvement: [plancomps@gmail.com](mailto:plancomps@gmail.com).  
Reports of issues: <https://github.com/plancomps/CBS-beta/issues>.

`give(X, Y)` executes  $X$ , possibly referring to the current `given` value, to compute a value  $V$ . It then executes  $Y$  with  $V$  as the `given` value, to compute the result.

$$\begin{array}{l} \text{Rule} \quad \frac{\text{given-value}(V) \vdash Y \longrightarrow Y'}{\text{given-value}(\_) \vdash \text{give}(V : T, Y) \longrightarrow \text{give}(V, Y')} \\ \text{Rule} \quad \text{give}(\_ : T, W : T') \rightsquigarrow W \end{array}$$

*Funcon* `given` :  $T \Rightarrow T$

`given` refers to the current given value.

$$\begin{array}{l} \text{Rule} \quad \text{given-value}(V : \text{values}) \vdash \text{given} \longrightarrow V \\ \text{Rule} \quad \text{given-value}(\_) \vdash \text{given} \longrightarrow \text{fail} \end{array}$$

*Funcon* `no-given`( $\_ : (\_) \Rightarrow T'$ ) :  $(\_) \Rightarrow T'$

`no-given(X)` computes  $X$  without references to the current given value.

$$\begin{array}{l} \text{Rule} \quad \frac{\text{given-value}(\_) \vdash X \longrightarrow X'}{\text{given-value}(\_) \vdash \text{no-given}(X) \longrightarrow \text{no-given}(X')} \\ \text{Rule} \quad \text{no-given}(U : T') \rightsquigarrow U \end{array}$$

**Mapping** Maps on collection values can be expressed directly, e.g., `list(left-to-right-map(F, list-elements(L)))`.

*Funcon* `left-to-right-map`( $\_ : T \Rightarrow T'$ ,  $\_ : (T)^*$ ) :  $\Rightarrow (T')^*$

`left-to-right-map(F, V*)` computes  $F$  for each value in  $V^*$  from left to right, returning the sequence of resulting values.

$$\begin{array}{l} \text{Rule} \quad \text{left-to-right-map}(F, V : T, V^* : (T)^*) \rightsquigarrow \\ \quad \text{left-to-right}(\text{give}(V, F), \text{left-to-right-map}(F, V^*)) \\ \text{Rule} \quad \text{left-to-right-map}(\_, (\_)) \rightsquigarrow (\_) \end{array}$$

*Funcon* `interleave-map`( $\_ : T \Rightarrow T'$ ,  $\_ : (T)^*$ ) :  $\Rightarrow (T')^*$

`interleave-map(F, V*)` computes  $F$  for each value in  $V^*$  interleaved, returning the sequence of resulting values.

$$\begin{array}{l} \text{Rule} \quad \text{interleave-map}(F, V : T, V^* : (T)^*) \rightsquigarrow \\ \quad \text{interleave}(\text{give}(V, F), \text{interleave-map}(F, V^*)) \\ \text{Rule} \quad \text{interleave-map}(\_, (\_)) \rightsquigarrow (\_) \end{array}$$

*Funcon* `left-to-right-repeat`( $\_ : \text{integers} \Rightarrow T'$ ,  $\_ : \text{integers}$ ,  $\_ : \text{integers}$ ) :  $\Rightarrow (T')^*$

`left-to-right-repeat(F, M, N)` computes  $F$  for each value from  $M$  to  $N$  sequentially, returning the sequence of resulting values.

$$\begin{array}{l} \text{Rule} \quad \frac{\text{is-less-or-equal}(M, N) == \text{true}}{\text{left-to-right-repeat}(F, M : \text{integers}, N : \text{integers}) \rightsquigarrow \\ \quad \text{left-to-right}(\text{give}(M, F), \text{left-to-right-repeat}(F, \text{int-add}(M, 1), N))} \\ \text{Rule} \quad \frac{\text{is-less-or-equal}(M, N) == \text{false}}{\text{left-to-right-repeat}(\_, M : \text{integers}, N : \text{integers}) \rightsquigarrow (\_)} \end{array}$$

*Funcon* `interleave-repeat`( $\_ : \text{integers} \Rightarrow T', \_ : \text{integers}, \_ : \text{integers}$ ) :  $\Rightarrow (T')^*$

`interleave-repeat`( $F, M, N$ ) computes  $F$  for each value from  $M$  to  $N$  interleaved, returning the sequence of resulting values.

*Rule* 
$$\frac{\text{is-less-or-equal}(M, N) == \text{true}}{\text{interleave-repeat}(F, M : \text{integers}, N : \text{integers}) \rightsquigarrow \text{interleave}(\text{give}(M, F), \text{interleave-repeat}(F, \text{int-add}(M, 1), N))}$$

*Rule* 
$$\frac{\text{is-less-or-equal}(M, N) == \text{false}}{\text{interleave-repeat}(\_, M : \text{integers}, N : \text{integers}) \rightsquigarrow ()}$$

**Filtering** Filters on collections of values can be expressed directly, e.g., `list(left-to-right-filter( $P$ , list-elements( $L$ )))` to filter a list  $L$ .

*Funcon* `left-to-right-filter`( $\_ : T \Rightarrow \text{booleans}, \_ : (T)^*$ ) :  $\Rightarrow (T)^*$

`left-to-right-filter`( $P, V^*$ ) computes  $P$  for each value in  $V^*$  from left to right, returning the sequence of argument values for which the result is `true`.

*Rule* 
$$\text{left-to-right-filter}(P, V : T, V^* : (T)^*) \rightsquigarrow \text{left-to-right}(\text{when-true}(\text{give}(V, P), V), \text{left-to-right-filter}(P, V^*))$$

*Rule* 
$$\text{left-to-right-filter}(\_) \rightsquigarrow ()$$

*Funcon* `interleave-filter`( $\_ : T \Rightarrow \text{booleans}, \_ : (T)^*$ ) :  $\Rightarrow (T)^*$

`interleave-filter`( $P, V^*$ ) computes  $P$  for each value in  $V^*$  interleaved, returning the sequence of argument values for which the result is `true`.

*Rule* 
$$\text{interleave-filter}(P, V : T, V^* : (T)^*) \rightsquigarrow \text{interleave}(\text{when-true}(\text{give}(V, P), V), \text{interleave-filter}(P, V^*))$$

*Rule* 
$$\text{interleave-filter}(\_) \rightsquigarrow ()$$

## Folding

*Funcon* `fold-left`( $\_ : \text{tuples}(T, T') \Rightarrow T, \_ : T, \_ : (T')^*$ ) :  $\Rightarrow T$

`fold-left`( $F, A, V^*$ ) reduces a sequence  $V^*$  to a single value by folding it from the left, using  $A$  as the initial accumulator value, and iteratively updating the accumulator by giving  $F$  the pair of the accumulator value and the first of the remaining arguments.

*Rule* 
$$\text{fold-left}(\_, A : T, ()) \rightsquigarrow A$$

*Rule* 
$$\text{fold-left}(F, A : T, V : T', V^* : (T')^*) \rightsquigarrow \text{fold-left}(F, \text{give}(\text{tuple}(A, V), F), V^*)$$

*Funcon* `fold-right`( $\_ : \text{tuples}(T, T') \Rightarrow T', \_ : T', \_ : (T)^*$ ) :  $\Rightarrow T'$

`fold-right`( $F, A, V^*$ ) reduces a sequence  $V^*$  to a single value by folding it from the right, using  $A$  as the initial accumulator value, and iteratively updating the accumulator by giving  $F$  the pair of the the last of the remaining arguments and the accumulator value.

*Rule* 
$$\text{fold-right}(\_, A : T', ()) \rightsquigarrow A$$

*Rule* 
$$\text{fold-right}(F, A : T', V^* : (T)^*, V : T) \rightsquigarrow \text{give}(\text{tuple}(V, \text{fold-right}(F, A, V^*)), F)$$
